unless otherwise stated

What is this?

What is this?

- This slide deck is created with **Typst** – a markup-based typesetting system
  - We use also **Polylux** for slide-related commands.
- The template `ufal.typ` is inspired by the ÚFAL Google Slides template and Milan Straka's SliMD template.
- It is different than the ÚFAL Marp template: see the comparison slide.

typst

Main features

📝 **Easy editing**: Create slides in your favourite text editor with live preview.

🕹️ **Multiple export formats**: Export to PDF or PNG.

🪧 **LaTeX support**: Mathematical typesetting with native Typst math.

⚡ **Advanced typography**: Use Typst's powerful layout system.

✒️ **Consistency**: Everything is nice and aligned without too much effort.

🦶 **Auto footer**: No more manual copying of the bottom orange bar 💪

🚀 **Popular framework**: Typst has excellent documentation and many extensions.

Typst vs Marp ⚔️

Should I use the **Typst template** (this one) or the Marp template?

Typst

- ✅ Nicer markup language.
- ✅ More powerful layout handling.
- ✅ Online collaboration.
- ❌ PDF-only - no interactive content.

Marp

- ✅ Simpler markup language.
- ✅ Interactive content (video, audio).
- ❌ Need to use HTML for advanced stuff.

How to use it?

Typst syntax 101

See the code and the tutorial on how to use the Typst markup syntax.

This is an H3 header.

- This is a bulleted list.
  - With a nested item.

1. And this is a numbered list.

You can also use **bold text**, *italic text*, links, `monospace`, etc.

—

With Typst, you can modify layout or text properties to your liking using functions such as `#text()` or `#align()`.

Slide layouts

This template uses Polylux, which provides various layout options:

- Use `#slide[content]` for regular slides
- Use `#title-slide`, `#section-slide`, and `#summary-slide` for special layouts.
- Use `toolbox.side-by-side` for two-column layouts.

> 💡 **Tip**
>
> You can also create info boxes with the helper function:
>
> - `#infobox(title: "Title", icon: "💡")[content]`

Image placement and sizing

Use Typst's image syntax to include an image:

```
#image("img/transformer.png", height: 3cm)
```

Math typesetting

You can render both inline math: $E = mc^2$ and separate equations:

$$\mathcal{L}(\theta) = \sum_{i=1}^{n} \log p(y_i \mid x_i, \theta) - \lambda \, \|\theta\|_2^2$$

⚠️ **Warning**

Typst math syntax is **different** from the LaTeX syntax.

Use this online convertor to convert your equations between these two.

This slide uses the `#blank-slide` command.

Code blocks & columns

Python code

Syntax highlighting is supported:

```python
def factorial(n):
    if n == 0:
        return 1
    else:
        return n * factorial(n - 1)
```

Javascript code

```javascript
function greet(name) {
    console.log(`Hello, ${name}!`);
}
```

i Note

Use `toolbox.side-by-side` to display content in multiple columns.

Tables and links

Model	Metric 1	Metric 2	Rating
not LLM 1	14.5	🟠	Mediocre
not LLM 2	5.5	🔶	Worst
not LLM 3	6.9	🟧	Even worse
LLM	**99.8**	🧡	Greatest thing ever!

- Tables automatically get proper styling.
- You can add source links using the `source-link` function.

Polylux Animation Features

Item-by-item lists

🎬 **Animation Controls**

Use `start: N` parameter to control when animations begin on specific subslides.

See also other 👉 Polylux features.

Polylux Animation Features

Item-by-item lists

- Basic bullet points

🎬 **Animation Controls**

Use `start: N` parameter to control when animations begin on specific subslides.

Practical tips

Live preview

Use any text editor with Typst support for **live preview**:

- VS Code with the Tinymist Typst extension
- Neovim with typst.vim
- Online Typst web app (useful also for collaboration)

Compilation CLI

```
$ typst compile slides.typ slides.pdf
$ typst watch slides.typ slides.pdf  # Auto-recompile
```

Summary

This template is the **dark horse** of all the ÚFAL templates 🔥

It is easy to use, extensible, and looks great.

Don't be lazy, learn **Typst**!
